Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt\_41:\* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Event=Alternative splicing, Named isoforms=3, Comment=Experimental confirmation may be lacking for some IsoId=Q9UHB6-2; Sequence=VSP\_003116; IsoId=Q9UHB6-1; Sequence=Displayed; isoforms; Name=Alpha;

Isofa-Q9UHB6-3; Sequence-VSP\_003117;
Note-No experimental confirmation available;
Note-No experimental confirmation available;
TISSUE SPECIFICITY: Highly expressed in placenta, kidney,
pancreas, prostate, ovary, spleen and heart. Also detected in
lung, liver, brain, skeletal muscle, thymus, testis and intestine.
Not detected in leukocytes. Eplin-beta levels are generally very
low. Eplin-alpha is abundant in epithelial cells from mammary
gland, prostate and in normal oral keratinocytes. Levels are low
in acrtic endothelial cells and dermal fibroblasts, and not

detectable in myocardium.

INDUCTION: Down-regulated in some cancer cell lines. Eplin-alpha is induced by serum. Eplin-beta is constitutively expressed. SIMILARITY: Contains I LIM zino-binding domain.

CAUTION: Ref. 4 (BAA91120) sequence differs from that shown due to a frameshift in position 697.

CAUTION: Ref. 5 sequence differs from that shown due to a frameshift in positions 365 and 662. --

Proc. Natl Acad. Sci. U.S.A. 85:1998-2002(1988).

-!- FUNCTION: NEUROPILAMENTS USUALLY CONTAIN THREE IF PROTEINS: L, M,

-ND H WHICH ARE INVOLVED IN THE MAINTENANCE OF NEURONAL CALIBER.

-!- PTM: THERE ARE A NUMBER OF REPEATS OF THE TRIPEPTIDE K-S-P, NFM IS PROSPHORYLATED ON A NUMBER OF THE SERINES IN THIS MOTIF. IT IS THOUGHT THAT PHOSPHORYLATION OF NFH RESULTS IN THE FORMATION OF INTERPLIAMENT CROSS BRIDGES THAT ARE IMPORTANT IN THE MAINTENANCE OF AXONAL CALIBER.

-- PLOUGHT THAT PHOSPHORYLATION SEEMS TO PLAY A MAJOR ROLE IN THE FUNCTIONING OF AXONAL CALIBER.

-- PLOUGHT THAT PHOSPHORYLATION SEEMS TO PLAY A MAJOR ROLE IN THE FUNCTIONING OF AXONAL CALIBER.

-- PLOUGHT THAT PHOSPHORYLATION SEEMS TO PLAY A MAJOR ROLE IN THE FUNCTIONING OF AXONAL CALIBER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PTM: PHOSPHORYLATION SEEMS TO PLAY A MAJOR ROLE IN THE FUNCTIONING OF THE LARGER NEUROFILAMENT POLYPEPTIDES (NF-M AND NF-H), THE LEVELS OF PHOSPHORYLATION BEING ALTERED DEVELOPMENTALLY AND COINCIDENT WITH A CHANGE IN THE NEUROFILAMENT FUNCTION. SIMILARITY: BELONGS TO THE INTERMEDIATE FILAMENT FAMILY.

Choi O.H., Park C., Itoh K., Adelstein R.S., Beaven M.A.;

Submitted (JUL-1995) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: CELLULAR MYOSIN APPEARS TO PLAY A ROLE IN CYTOKINESIS,
CELL SHAPE, AND SPECIALIZED FUNCTIONS SUCH AS SECRETION AND
CAPPING.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Antagonists and antagonists of LIPAP, and to raise specific antibodies. Antagonists and antagonists of LIPAP, are useful for treating diseases associated with reduced or increased levels of LIPAP, e.g. cardiovascular, neurological and gastrointessinal cased encoding LIPAP are useful for detection of full length coding acid encoding LIPAP are useful for detection of full length coding sequences, in Mybridization and/for amplification assays or for diagnosis or monitoring. Nucleotides encoding LIPAP are used to screen for compounds that specifically modify LIPAP expression, to screen for compounds that specifically modify LIPAP expression, therapeutic antisense, triplectides encoding LiPAP, in gene therapy, as a source of therapeutic antisense, triplex-forming, or ribozyme agents and for genomic mapping antibodies to the proteins are used for diagnosis and monitoring of LIPAP, associated disease by immunoassay, as antagonists, in competitive drug screens and for affinity purification of natural LIPAP. 1 MESSPENKRQWTSLSLRVTAKELSLVNKNKSSAIVEIFSKYQKAAEETUMEKKRSNTENL New human lipid-associated proteins, nucleic acids, and antibodies, useful for diagnosis, treatment and prevention of e.g. cardiovascular 1 MESSPFNRRQWTSLSLRVTAKELSLVNKNKSSAIVEIFSKYQKAAEETNMEKKRSNTENL 100.0%; Score 3927; DB 21; Length 759; 100.0%; Pred. This invention describes novel polynucleotides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity and to down regulate expression and activity and to down regulate. This sequence for presence of polypeptides in samples. This sequence represents a polypeptide described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAAM36642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynuclectides are useful in gene therapy. A composition containing a polypeptide or polynuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as particheral nervous injuries, peripheral nervous system, such as particheral nervous injuries, peripheral nervous system, such as a lateables and central nervous system diseases, amyotrophic lateal sclerosis, and Sh-Drager Syndrome. Other uses include the utilisation of the activities such as Immune system suppression, and thrombolytic activity, chemotectic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders.

New tumor suppressor protein EPLIN, useful as a marker for diagnostic, prognostic and therapeutic applications over the course of cell proliferative disorders associated with EPLIN

WPI; 2001-244555/25. N-PSDB; AAF55697. Chang DD, Maul RS;

Claim 1; Page 44; 59pp; English.

The present sequence represents a human EPLIN (epithelial protein lost in neoplasm) -beta isoform. The specification also describes EPLIN-alpha.

EPLIN is a tumour suppressor protein, whose expression is altered in multiple common human tumour types. EPLIN nucleic acids and proteins are used in screening assays to detect molecules that specifically bind to EPLIN nucleic acids, proteins or derivatives and thus have potential use as agonist or antagonist of EPLIN, in particular molecules that affect call proliferation. Thus the assays are useful for screening molecules with potential utility as anticancer drugs or lead compounds for drug development. EPLIN nucleic acids, proteins are useful for detecting a cell proliferative disorder in a subject. EPLIN polynucleotides are useful in gene therapy techniques. EPLIN is useful as a marker that can be diagnostically, prognostically and therapeutically used over the course of a cell proliferative disorder associated with EPLIN.

AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB4337, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatoropic; vulnerary; antiporatatic; antiporations in noctropic; neuroprotective; coteopathic; anticonvulsant; antiarthitic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermaclogical; immunosuppressive; antidiabetic; predisposition to, or preventing or treating the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthitis, graft vs host disease, cardiovascular disease, diabetes mellitus, erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, necturnal haemoglobinuia, antilinfammatory disease; to enhance contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CNNKLSLGTYASLHGRIYCKPHFNQLFKSKGNYDEGFGHRPHKDLWASKNENEEILERPA 479

New tumor suppressor protein EPLIN, useful as a marker for diagnostic, prognostic and therapeutic applications over the course of cell proliferative disorders associated with EPLIN
```

Human breast tumour-associated protein

08-DEC-1999

Claim 1; Page 43; 59pp; English

The present sequence represents a human EPLIN (epithelial protein lost in neoplasm) -d.pha isoform. The specification also describes BPLIN-beta.

EPLIN is a tumour suppressor protein, whose expression is altered in multiple common human tumour types. EPLIN nucleic acids and proteins are used in screening assays to detect molecules that specifically bind to EPLIN nucleic acids, proteins or derivatives and thus have potential use as agonist or antagonist of EPLIN, in particular molecules that affect cell proliferation. Thus the assays are useful for screening molecules with proteintal utility as anticaner affect acids, proteins are useful for detecting a development. EPLIN nucleic acids, proteins are useful for detecting a cell proliferative disorder in a subject. EPLIN polynucleotides are useful in gene therapy techniques. EPLIN is useful as a marker that can be diagnostically, prognostically and therapeutically used over the course of a cell proliferative disorder associated with EPLIN. protein lost in

Primer sets for synthesizing polynucleotides, particularly the 5602 full-length oDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.

8; SEQ ID 17992; 2537pp + CD ROM; English Claim The present invention describes primer sets for synthesising 5602 (11)-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary of the complementary strand of a polynucleotide which comprises one of the 562 nucleotide sequences defined in the specification, where the oligonucleotide comprises ar least 15 nucleotides; or (b) a combination of an oligonucleotide comprises a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 1'-end sequence. Where the oligonucleotide which comprises a 1'-end sequence, where the oligonucleotide which comprises a 1'-end sequence, the complementary to a polynucleotide of the primer sets can be used in antisense therapy and the specification. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by cDNAs assily without any specialised methods. AAH031650 and AAH13632 to AAH13632 to AAH13632 con AAH13632 con the present human amino acid sequences; and AAH13632 to AAH13632 con the present inventions. the present invention

Also described is the process for preparing the protein and nucleic acid sequence, and the method for detecting hSREBP-3

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, complying and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as (II). (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in classomatics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and can an ord sequences of the invention.

Note: The sequence data for this patent did not appear in the printed considers in the printed of a for this patent did not appear in the printed affect with a for a fer wine, in family and recommender.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       378
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       208

Naw isolated nucleic acid molecules encoding 49 human secreted proteins used for preventing, treating or ameliorating medical conditions, for diagnosing pathological conditions or as food additives or

Disclosure, Page 412-413; 419pp; English.

The polynuclectide sequences given in AACS9449 to AACS947 encode the human secreted proteins given in AAB34092 to AAB34140. AAB34141 to AAB34161 represent human secreted polypeptide sequences and proteins can dealls the genes are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissue and cells the genes are expressed in. Examples of activities include: CC and cells the genes are expressed in. Examples of activities include: CC artiarthritic; immunosuppressive; antirhwantic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; on everyprotective; antibacterial; virucide; fungicide; ophthalmological; and vulnerary. The polynucleotides and polypeptides can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, or rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a untoimmune diseases, hyperproliferative disorders e.g. neoplasms or cancer of the breast or liver, cardiovascular disorders, oresprovascular disorders, angiogenesis, nervous system disorders, infections caused by bacteria, viruses and fungi and ocular disorders, infections caused by the breast or aid wound healing and epithelial cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to capabilities. AACS9410 to AACS9448 and AAB34091 represent sequences used in the exemplification of the present invention.

AAC98773 to AAC99231 encode the human pancreatic cancer associated proteins, called pancreatic cancer antigens, given in AAB54008 to AAB54466. The human pancreatic cancer antigens have cytostatic, neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive, gynaecological, cardiant and antiinflammatory activities, and can be used in gene therapy. The polynucleotide and proteins can be used for preventing, treating, or ameliorating a medical condition or in assays

for diagnosing a pathological condition or a susceptibility to one in a subject. Binding partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer.

Agonists and antagonists to the antigens can be used to design nucleic pancreatic cancer antigen polynucleotides can be used to design nucleic cancil hybridisation probes that can be used in chromosome mapping, linkage analysis, tissue identification and/or typing and a variety of forensic and hagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to great or prevent neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal or proliferative disorders. AAC99212 to AAC99240 and AAB85467 represent sequences used in the exemplification of the present invention.

proceins nay activities dependent on the tissues and cells in which they are expressed. Examples of their activities include immunosuppressive; antiarthritic; antirheumatic; antiproliferative; cytostatic; cardian; vasotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; fungicide; opthalmalogical; and vulnerary. The secreted proteins, polynucleotides, antagonists and agonists may be useful in treating, preventing and/or diagnosing diseases and disorders such as autoimmune diseases. Green thematoid arthritis, hyperproliferative disorders e.g. rheumatoid arthritis, hyperproliferative of cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. Alzheimer's disease, angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypetides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to suburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals calcators and other nutritional components. Organoments of the proteins and other nutritional culture of the solation and characterisation of the proteins and amino acid sequences with which they share homology. The genes and proteins have activities dependent on the tissues and cells in which they Polynucleotide sequences AAC93479 - AAC93527 represent cDNA encoding human secreted proteins AAB51827 - AAB51875. Sequences AAB51876 - AAB51927 represent alternative polypeptides encoded by the genes, and

New isolated nucleic acid molecules encoding 49 human secreted proteins used for preventing, treating or ameliorating medical conditions, for diagnosing pathological conditions or as food additives or

Disclosure; Page 411-412; 419pp; English

The polynucleotide sequences given in AACS9499 to AACS9497 encode the human secreted proteins given in AAB34092 to AAB34140. AAB34141 to CAMB3416 represent human secreted polynpeptide sequences and proteins and collaboration of the present invention. Human secreted proteins have activities based on the tissue and cells the genes are expressed in Examples of activities include: CC antiarthritic; immunosuppressive; antitheumatic; antiproliferative; cycostatic; cardiant; vasorropic; artitrhritic; immunosuppressive; antitheumatic; antiproliferative; cycostatic; antibacterial; virucide; fungicide; ophthalmological; and vulnerary. The polynucleotides and polypeptides can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits; goats, horses, cats, dogs, chickens or sheep. They are also used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, indiagnosing a pathological condition or susceptibility to a cancer of the breast or liver, cardiovascular disorders, cerebrovascular disorders, angiogenesis, nervous system disorders, infections caused by bacteria, viruses and fungi and ocular disorders, infections caused by bacteria, viruses and fungi and ocular disorders, repoppitides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before as a food additive or preservative to increase or decrease storage capabilities. AACS9440 to AACS9440 to increase or decrease storage capabilities. AACS9440 to AACS9440 to increase or decrease storage in the exemplification of the preservation.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
